

# OBC FileCloud

- easy, professional and secure file sharing

OBC FileCloud is the **easiest** and **most secure** way for businesses to **share, synchronize** and **manage** files across computers and mobile devices. The users have access to their files on **any device** from any location – even without an internet connection.

## Challenge

Trends such as mobile workforce and bring your own device (BYOD) increase pressure on IT departments to manage and secure devices and data. The need to collaborate and share data with third parties, customers and partners add to this chaos and complexity. Users increasingly turn to unsecure, consumer-style cloud services for access to their data and files across all of their devices, as well as the ability to share those files with others. These consumer-focused solutions do not provide adequate security, management and enterprise oversight.

## Solution

To help IT regain control over employee file sharing, The Online Backup Company offers an enterprise-class, secure and robust service that meets the mobility and collaboration needs of all users.

All data is stored in secure data centres at two different locations in Norway. OBC uses multiple data centres to its application and data, providing essential redundancy and security. All data centres employ physical security, strict access policies and secure vaults and cages against fire, flood and technological disruption.

## Key benefits

- Encrypted transfer and storage of data
- Remote wipe in the event of theft or loss of a device
- Synchronization of data across multiple devices
- Password protected sharing
- Access from any PC, Mac or mobile device
- Mobile apps
- Folder & File sharing
- File version control and recovery
- All data is backed up and stored in Norway

## Secure File Sharing – control where your files are stored

### Encrypted local drive

OBC FileCloud creates a secure area on your local hard drive, the Vault. Vaults act just like a hard drive on the user's computers, storing important documents in one place with remote access. Users simply drag and drop their files into the virtual local drive, and data is immediately encrypted, backed up and available for sharing with others.

### Remote Wipe

Keeping your local data encrypted and password protected, is only the first line of defense against data theft. In the event your computer is stolen, OBC FileCloud uses a unique serial number assigned to each device to give the ability to remove all files and folders on your OBC FileCloud Vault as soon as someone try to access them. The tracking allows to locate the missing device on Google Maps.

## Continuous file backup

Hard drives crash and computers get stolen, but that doesn't mean data will be lost. Every time a file is changed or a new file is saved on a Vault, it gets backed up and stored in OBC's data center. OBC FileCloud service works quietly in the background without interfering with your productivity. All files are backed up to redundant servers and stored in our data center.

## Restore a previous version

Security is also available when files are accidentally deleted. So even if you saved a bad change, or if the file has been damaged or deleted, you can restore the file to an older version with only a few clicks. OBC FileCloud retains 14 daily backups of all you data. This allows you to retrieve the past version with a simple restore function from the OBC FileCloud portal.

## File Sharing and Collaboration

### Folder & File Sharing

OBC FileCloud makes it simple to share files internally as well as with external partners, clients and vendors. Whether you are sharing one file, or an entire folder with hundreds of files, a few clicks is all it takes. When recipients click the link, they will be able to download the file or the entire folder. You can send password protected or public links from your desktop, from the web, or from your smartphone or tablet.

### Collaborate with shared folders

OBC FileCloud allows you to provide access to an entire folder of files on your secure server. Instead of initiating a file download, Folder link directs the recipients to a web page where they can view and upload files, if given authority to do so. Folder Link is simple to use and can replace more complicated services like FTP.

### Apply folder permissions

OBC FileCloud gives you flexibility and security when sharing information. You can give permission for others to edit files so that your team can collaborate on a project. Or you can share a folder as "read-only" so recipients can view the files, but cannot make changes. Your data is always up-to-date and available to team members, whether they are online or offline. The service automatically synchronizes and updates files to the OBC's data center and across the local drives of your team members.

### File notifications

Keep track of when others add, delete, or modify files within your shared Vault. File Notifications allow you to set e-mail alerts on specific files or entire Vaults so you can keep track of any changes to your files and easily discover new and updated content.

### Get mobilized - access and share files from anywhere

#### Remote access from any browser

Get remote access to your files, photos, and media from anywhere. Just log in to the OBC FileCloud's online dashboard from any computer to access your important folders and files. You can view your Vaults, upload multiple files at once, preview photos, or move, copy and rename files.

#### Mobile access

With OBC FileCloud Mobile App, you have access to all of your data, right from your smartphone or tablet. The solution includes 5 mobile apps allowing easy access to your files from any major platform. Mobile apps are available for iPad, iPhone, Android, Windows Phone and Blackberry.

#### Powerful sync across computers and devices

There is no need to worry about synchronizing files and folders – simply drag and drop or save documents directly to the Vault – and OBC FileCloud does the rest. Every time the user log on, OBC FileCloud scans the online Vault and automatically synchronizes the files that have been added or changed by other team members.
